Aspect - Configuration

Complexity

Complexity is an excess of structure in y that resists simplification; many parts interact nontrivially. It indicates inherent confusion not belonging to the observer.

complexity, many entities, irreducibility, non-linearity, feedback, chaos, emergence, computational hardness, mixtures, entanglement, confusion

1. Choose a keyword x on this card.
2. Choose a target y , attach this card if possible.
 y may be any card, domain, object, or topic.
3. Interpret $x(y)$: Think of aspect x of target y .
If y is attached to target z , interpret $x(y(z))$.

Aspect cards modify what aspect of a target y is investigated.

Cross-reference: For clarification, compare this tree to every other tree.
