Autoencoder

Complicated Identity

Chameleon - Identity

Autoencoder

Data encoded, passed through a bottleneck, and then decoded. What sounds like a pointless exercise allows compression, simulation, and understanding of latent structures that only appear after deep transformations.

encoder, decoder, bottleneck layer, latent variables, generative modeling, compression vs. memorization

Discovers latent structure, compresses and simulates with minimal explicit modeling.

Becomes an elaborate memory device, storing rather than understanding.

Reconstruct the target card's effect using only five words.

"Is your latent space meaningful?"

The actor could redraw anything from only a handful of numbers. But when asked what those numbers meant, it offered only another perfect portrait.
