Drifter

Chameleon - Identity

Online Learning

Some models are meant to go with the flow and adapt while encountering new data. They adapt to changing input distributions over time and never achieve the stability that is both boon and curse in a drifting world.

fast adaptation, sequential updating, drift, continuous adaptation, nonstationarity, temporal instability

- ▲ Learns instantly from new regimes; thrives in nonstationary environments.
- ▼ Never stabilizes; outputs drift unpredictably, eroding coherence.
- ▶ Ask of the target card: is its input or effect stationary, or is it quietly drifting?

"Are you forcing a stable model onto a moving world?"

The Drifter survived every shift in landscape, audience, and script. Yet each time someone saw its play twice, they saw a different story. It left them confused as to what the actual ending of the play was.
