Great Rehearsal

Chameleon - Performance

Train/Test Mismatch

After training, the model is optimized for the training data. When the test data or the real application do not follow a similar distribution or the model was overfitted, then there will be issues with generalization.

generalization gap, overfitting, train/test distribution, spurious relations, robustness

- ▲ The behavior learned by the model is appropriate for the real task.
- ▼ The training loss is good but performance during deployment is bad.
- ▶ Think of someone you know. How might they interpret target card?

"What part of your model might not generalize well?"

The advisor whispered: "Trust yourself and the director." When the curtain rose, the director laughed and laughed but the audience sat stony-faced, growing more angry by the minute.
