Memory Artist

Chameleon - Identity

Selective Processing

For some tasks, there can be an overwhelming amount of data that is relevant simultaneously. Then we need model architectures, that can process and later selectively remember information when it is relevant.

memory, attention mechanisms, transformer, RAG, long-range dependence, context windows

- ▲ Prioritizes what matters; retrieves and emphasizes the most relevant traces of past
- ▼ Misguided attention amplifies irrelevant cues while crucial information fades.
- ▶ Remove the target card, try to remember it was there.

"What does your model choose to remember?"

The Memory Artist walked among countless stories always carrying a small lantern. Whatever the lantern illuminated was engraved in the hearts of the audience; whatever lay in shadow vanished forever.
