Modular Model

Often it is possible to create a model from prefabricated, pretrained parts of other models. This is useful, when reliable partial solutions exist or speed and efficiency of modelling are key.

pretrained components, mixture of experts, transfer learning, interface layers, SotA integration, no training

- ▲ Reuses strong pretrained components; achieves high performance with minimal new training.
- ▼ Interfaces misalign; modules fail to communicate, creating incoherence.
- ▶ Identify which parts of the target card are fixed, which are adaptable, and how they connect.

"Do your components truly collaborate, or are they merely bolted together?"

They built a performer from the finest pieces of many troupes. Each piece was excellent yet together the monstrosity stumbled; its wiring weak and stench rotten.
