Chameleon - Composition

Hyperparameters

Not everything can be learned from data. Some overall design specs like network architectures or information flows as well as quantities like search radii or learning rates are fixed by the user, sometimes arbitrarily.

hyperparameter optimization, structural constraints, sensitivity to configuration, implicit biases/architecture

Hyperparameters are meaningfully derivable from data or context.

Performance depends sensitively and opaquely on arbitrary choices.

Decide some values for target card and don't go back on them.

"Which of your modeling choices are principled, and which are inherited defaults?"

Before the actors ever rehearsed, lines were drawn on the floor. No one understood where they came from but everyone obeyed in placing furniture and feet within their boundaries.
