Optimization

Workshop

Chameleon - Composition

Optimization

The optimizer is supposed to take anything adjustable in the model and figure out the best values for it. Since this problem is hard, no general solver exists and different techniques are suitable for different models.

solver-model dynamics, nonconvexity, gradients, convergence, parameter tuning, exploration/exploitation

- ▲ Shapes the model robustly toward a solution; uses gradients, Hessians, constraints.
- ▼ The final model reflects the optimizer more than the data; training artifacts and hacks dominate.
- ▶ Interpret target card in a way that fits you best and flip it to Virtue.

"Which of your results depend on the optimizer most strongly?"

In the workshop, nothing is safe. When the director wants the furniture adjusted, everyone starts hammering away. Varying results and accidents are part of the entertainment.
