Observation

What actually appears in evidence. The event itself may be absent; what remains are traces: regular, chaotic, singular, or multiple patterns at once. The form in which the phenomenon becomes observable experience.

Inference from evidence the world provided.

Overinterpreting data because there is nothing else.

Treat the target card as observation; infer what might have produced it.

"What do I actually see?"

Marks remain. Some repeat. Others are singular. Some diverge, some superimpose, some stay unobserved. All of this is just words. The site is not.
