(In)equality constraints

Constraints declare what the model may attempt. They constrict via equalities that enforce and inequalities that guard. A constraint always decreases what is possible and the truth is not safe from this exclusion.

feasible region, interior points, convexity, cones, hard vs soft constraints, projection, duality, slack variables

Set the bounds of what is logical, possible, physically feasible.

Collapse possibilities to exactly what you suspected anyway.

Relax or tighten conditions of target card, notice the impact.

"What do I forbid—and why?"

The divider bit the plate – arcs nested inside arcs. "Now the world is tidy," the first one said. "Now the world is smaller," replied the second, pointing at the scratch that was once the capital.
