Likelihood Function

How well model and data fit together. Each data point is an observation of reality, each likelihood a judgement of how it fits. This reveals how parameters change plausibility, our instrument of navigation.

objectives, log-likelihood landscape, score function, evidence, densities, gradients, information metrics

Guides search and comparison to match model and source via data.

A single pattern is an incomplete story. Overfit and the pattern becomes your map.

Drop your preconceptions about target card, purely go by evidence.

"Where does the evidence point? How does it clash with constraints, and my own ideas?"

The cartographer etched the land of likelihood in gold. But the world dreamed of being understood and as new data arrived, all the rivers needed to be redrawn.
