

Nested Treasures

Hierarchy in models

Nested Treasures

Structure - Ordered Knowledge

Hierarchy in models

Hierarchy organizes dependency across scales: sub-effects within super-effects, sub-groups within super-groups, sub-laws within super-laws. Shares order and stability across levels but can confound and obfuscate.

hyperpriors, multilevel models, pooling, conditional independence structure, group-level variation

Spreads knowledge between parts without confusion.

Too many levels blur meaning, containment relations all wrong.

Stack two played cards vertically; declare which depends on which.

"Could I would switch two levels without the model breaking?"

Within every treasure lies another. They opened box after box until they found only a mirror. It showed the treasury itself, the first box resting on the table as if never touched.
