Probability Subsystems

The probabilistic machinery by which knowledge becomes formal architecture. Distributions give uncertainty shape, likelihoods judge, priors encode expectation, hierarchies organize effects across levels.

Turns probability into a coherent system of belief, evidence, and update rules.

Hides all manner of mistakes and dogma behind a polished probabilistic form.

Treat target card as a probabilistic subsystem with prior, likelihood, and evidence.

"How is uncertainty assembled before the model is allowed to learn?"

In the treasury, the relics were arranged by silent law: golden shapes, moving maps, old lexicons, singing instruments, boxes within boxes. Individually, they promised knowledge. Together they promised a world.
