Void - Void Dynamics

Model Expansion

Model expansion is an autocorrelated process that follows empirical rules. Consequently also the reduction in possible model designs is not independent for each modelling step.

model growth, graph expansion correlated appearance / exclusion, decision cascade, hypothesis propagation

Model components added logically making the graph expand outward.

Expansion without plan silently rules out more reasonable alternatives.

Explain how you would expand target card to make it more complete.

"Which additions were truly independent, and which were implied?"

*We add another star! We add another rule! More, more!
We are crawling, glorious! Fewer paths. Faster Running!
Sharp teeth!*
