Void - Void Geometry

World-model interface

The boundary layer where Source and Volition enter the model via imperfect translation. All reality has to cross that layer at least once to manifest in M. Results produced with M also have to cross back again.

boundary layer, translation, representation loss, functorial maps, world-model map, model-world map

World and will translated into representation meaningfully.

Assuming that crossing the model boundary is a faithful conversion.

Convert target card into a different domain.

"What is lost, invented, or transformed when reality crosses into my model?"

Bring your world to me. I will help you over its boundaries. It only hurts once.
