

Interior Void

Model internal absences

Interior Void

Void - Interior Void

Model internal absences

Interior Void is absence within the model. The system runs, but entire dimensions, relations, or outputs were never constructed. It is unbuilt architecture.

nodes, edges in a DAG, input/ output/ dimension/ representation/ explanation/ boundary conditions

The models internal flow is an efficient and explainable representation of the phenomenon.

Model incapable of incorporating important entities and relations.

Think of target card in terms of internal flow of information.

"What might be missing in the graph that represents my model?"

This labyrinth goes on forever. Entry, Exit? The corridors all look arbitrarily generic and traversing them means nothing.
