

No Guidance

Degree of Supervision

No Guidance

Void - Exterior Void

Degree of Supervision

Absence of supervisory signal and corrective influence where the model might benefit from it. Where measurable reward signals are missing, unsupervised approaches replace them with interior quality metrics.

unsupervised learning, reinforcement learning, weak supervision, label absence, partial labels

Existing data is used, the rest is improvised.

Complacency with model that is unguided in important areas.

Where does target card point for further investigation?

"Where does my model need guidance but there is no signal?"

I was hoping it would show me the way out of here. But it did not want to help. Just shines emptiness into emptiness.
