Boundary of computation

Source | Sink Void

Void - Interior Void

Boundary of computation

Beginnings and endings of computational chains should represent some meaningful chain of transforms. But sometimes they are arbitrary or legacy, and could have had an entirely different architecture.

computational graph, DAG segmentation, initializations, boundary conditions, terminal assumptions

Computations start with assumptions, end in meaningful quantities

Computational chains could begin or end elsewhere.

Ask of target card where it really begins or ends.

"Could there be an extra upstream or downstream stage to this computation?"

I have seen this corridor many times. I never know what triggers its appearance. I have no choice but to run it fast. When I hit the wall on the opposite side, many things disappear.
