

The Void

Model Complement

The Void

Void -

Model Complement

The complement V of the model M . V is what M is not and their union is the totality $T = M + V$ of all possible models. The void $V = T - M$ is the space of model components that are excluded or remain undecided.

negative space of modelling, nonmodel, universe of models, exclusion, indecision, ontology of modelling

Recognizing model and its boundaries as a subset of possibility with a vast complement.

Mapping endless possibility does not translate to better models.

Declare target card to be the universal background, active everywhere.

"What remains outside my model — and how large is it?"

Everything Not
