## Void - Void Dynamics

### Model Space dynamics

Void Dynamics describes how modeling decisions trace a trajectory through model space. Growing  $M$  shrinks  $V = E + U$  and redistributes its elements among excluded ( $E$ ) and undecided ( $U$ ); a map for each step.

model evolution, decision mass redistribution, impact of inclusion/ deletion/ exclusion on model space  $T$

Clarifies how model space partition evolves in a correlated manner during modelling.

Paralysis through overanalysis of hidden consequences.

Ask, how target card will shape the space around it.

*"How does the model space evolve under my decisions?"*

*We will eat all. Eat the first light into the dark. Chewing. Chewing! Till all shines gloriously. Briefly! Then eat it back again to the dark place!*
