## Void - Void Geometry

Model space partition

Modeling conserves total possibility. Decisions redistribute components from the Totality  $T$  of possible model components between chosen  $M$ , excluded  $E$ , and undecided  $U$ . Therefore  $T = M + E + U = M + V$ .

geometry, topology, partition, choice, exclusion, indecision, uniformity, preference, boundary

Perfect accounting: every component becomes chosen, excluded, or still open.

Getting lost in mapping absent components, willing them into the model.

For target card, name what it chooses, excludes, leaves open.

*"What do I chose, exclude, or refused to decide so far?"*

*Stand at my edge. Look into my eyes. Count all those things that might have been yours.*
